

VMMS

Vseries

Vehicle Multi-Message System

Key Features

- Broadcasts up to 11 different messages or recorded sounds
- Separate speaker outputs ideal for driver and saloon audio
- Fully integrates with Firetrace Fire Suppression System
- Bespoke audio clips available
- 12VDC and 24VDC Applications
- EMC Approved to 2004/104/EC

Description

The VMMS is a distinctive and bespoke solution for providing clear and concise audible warning messages or status information to drivers and passengers alike. Each unit can broadcast up to 11 different audio clips through two separate speaker outputs - these are independent of each other to allow driver/passenger audio separation.

Fire Suppression Integration

As part of the Firetrace Fire Suppression System, the VMMS acts as the control hub for each of the monitoring devices. The unit includes a specific feature to monitor the status of the system pressure, engine bay temperature and saloon smoke detector. A total of 5 confirmation and warning messages keep the driver informed of the systems status. The remaining capacity of the VMMS is available for any other audible warning or information requirements.

Bespoke Audio Options

The VMMS includes a number of input connections, which each activate the broadcasting of pre-programmed audio clips. An extensive range of spoken messages are already available, but custom messages or sounds can be requested. This flexibility allows the VMMS to be used as either a warning system for driver alerts, or to provide informative feedback to passengers such as with a 'Bus Stopping' announcement. The VMMS could also be used to replace multiple buzzer and bell combinations with a single unit.
